

A short note on 2D integrator implementation

K. R. Pedersen, 201709218

Abstract

In this note I shortly describe the ideas behind my two-dimensional integrator implementation.

1 Introduction

The task is to numerically calculate two-dimensional integrals of the form

$$I = \int_a^b dx \int_{d(x)}^{u(x)} dy f(x, y), \quad (1)$$

by consecutively applying an adaptive one-dimensional integrator along each of the two dimensions. Let

$$F(x) := \int_{d(x)}^{u(x)} dy f(x, y), \quad (2)$$

so that

$$I = \int_a^b dx F(x). \quad (3)$$

The integral I is estimated by a weighted sum of the form

$$I \approx \sum_i w_i F(x_i), \quad (4)$$

where the function values $F(x_i)$ are given by the integrals

$$F(x_i) = \int_{d(x_i)}^{u(x_i)} dy f(x_i, y), \quad (5)$$

and estimated as a weighted sum in a similar fashion

$$F(x_i) \approx \sum_j \omega_j f(x_i, y_j). \quad (6)$$

Eq. (6) is estimated using the one-dimensional recursive adaptive integrator introduced in the coursework, along the y-direction. Here, I have used the same reusable points and weights as those given in the lecture notes. After having the estimation of the function $F(x)$ defined in Eq. (2), I estimate the final integral I using the exact same one-dimensional adaptive integrator, now along the x-direction.

As we apply the one-dimensional adaptive integrator consecutively along the two directions, the strengths and weaknesses of the one-dimensional integrator are reflected in the two-dimensional integrator. This is most noticeable when singularities are present. In the algorithm, we determine the Riemann sum along both directions, and this can deal with singularities. However, it is not so effective and it takes time to reach convergence in this case. In the course, we have seen that performing a Clenshaw-Curtis transformation makes the integration algorithm converge faster when singularities are present. Therefore, for a more effective two-dimensional integrator, one could have included the Clenshaw-Curtis transformation in the one-dimensional integrator along the two directions.
